DEVELOPMENT PROPOSAL

Drop Tracker

Native iOS & Android App

Converting the existing web prototype into native mobile applications built in Flutter, with real device reminders, the same core data model and taper logic, and submission to the App Store and Google Play.

Flutter • iOS + Android

Native Reminders

Canadian Data Region

Store Submission Included

PREPARED FOR
Claudine Courey
Drop Tracker

PREPARED BY
Waseem Mirza
@Codetivelab on Fiverr

DATE
31 July 2026

01 Project Overview

Drop Tracker currently exists as a working web prototype built on a no-code platform. It already includes almost all of the features the native mobile apps will have: multiple medications with custom dosing times and per-eye assignment, six frequency modes, taper schedules with start and end dates, a daily "today" checklist and history log, adherence reporting, and a guest mode that stores data locally without requiring sign-in.

The gap is reminders. The prototype uses a calendar (.ics) export as a workaround because it cannot schedule notifications on the device. **The native version replaces that workaround with real local reminders that fire whether or not the app is open**, and carries the rest of the product across with the same core data model and taper logic.

The apps will be built in **Flutter** — one codebase compiled to native iOS and Android — with a simple, clean UI following the colour scheme and layout of the existing prototype.

02 User Flows to Be Rebuilt

The six flows documented in your walkthrough, reproduced in the native apps.

1 Onboarding

Welcome / disclaimer screen → tick "I understand" → Get Started → Personalize (name, waking hours) → Continue → Quick Start → "Cataract Surgery" preset (auto-creates 3 medications) or "I'll add my own" (empty list) → lands on the Today dashboard.

2 Dose logging

Today dashboard shows the next due dose in a banner with the full chronological list below → tap the checkmark on a dose row → Confidence Check modal → Took it / Not sure it went in / Snooze 10 min / Skip this dose (or Cancel) → modal closes, the row updates, the day's progress bar increments, and the entry is written to History.

3 Add medication

Meds tab → Add → medication name, bottle cap colour, which eye, frequency (auto-fills or reveals dose-time fields depending on the choice), start date, ongoing / end date, special instructions, notes, optional taper steps → Save Medication → returns to the list with the entry added and immediately reflected on Today.

4 Edit / delete medication

Meds tab → pencil icon → Edit Medication form opens pre-filled → change any field → Update Medication → returns to the list with changes applied. The trash icon permanently deletes that medication and its future reminders.

5 History & reporting

History tab → 7-day / 30-day adherence and streak → browse months with the arrow buttons → tap a calendar day to expand that day's dose-by-dose log → Doctor Report generates a printable adherence summary → Print.

6 Settings

Settings tab → edit name / waking hours → Save Settings persists and recalculates auto-suggested dose times app-wide → Add all reminders to Calendar exports a combined .ics file → Restart Onboarding replays the 3-step flow without erasing medications → Log Out ends the session.

03 Screens, Elements & Behaviour

Every screen, field, button and behaviour recorded in your documentation, carried into the native apps.

3.0 Feature Summary

MODULE	FEATURES INCLUDED
Onboarding	Welcome screen with safety disclaimer and gating "I understand" checkbox · three-step progress indicator with Back navigation · first-name capture · waking-hours (wake / bed) time pickers · "Cataract Surgery" quick-start preset creating three medications · "I'll add my own" empty-start option
Today dashboard	Personalised greeting · next-dose banner with live countdown · today's progress counter and progress bar · full chronological dose list with time, bottle-cap colour, medication, eye(s) and instruction tags · automatic "wait between drops" spacing banners · Confidence Check modal with Took it / Not sure / Snooze 10 min / Skip / Cancel · four-tab bottom navigation
History & reports	7-day and 30-day adherence percentages with dose counts · perfect-days streak · month-by-month calendar heat-map with colour legend · tappable day cells expanding a dose-by-dose log with timestamps · Doctor Report with per-medication Adherence / Taken / Missed / Unsure breakdown · print or save as PDF
Medications	Medications list with per-row Add to Calendar, Edit and Delete · Add and Edit forms · medication name · eight bottle-cap colours · Right / Left / Both eye selector · six frequency modes · dose-times editor with add and remove · Every N hours interval · start date · Ongoing or End date · five special-instruction checkboxes · free-text notes · multi-step taper schedule builder with auto-computed times
Settings & account	Editable name and waking hours driving app-wide dose spacing · persistent safety disclaimer · combined .ics calendar export · Restart Onboarding · guest mode with local storage and no sign-in required · Log Out · app version footer
Mobile-only	Native device reminders · Privacy Policy and Terms of Service links · in-app account deletion for iOS · web portal for the Android account-deletion flow · battery-optimisation guidance screen (see Section 04)

3.1 Onboarding

SCREEN	ELEMENTS & BEHAVIOUR
Welcome / Disclaimer Step 1 of 3	App purpose intro plus the safety disclaimer that Drop Tracker is a reminder and tracking tool only, not a medical device, and does not provide medical advice. The disclaimer text is informational; the "I understand" checkbox toggles on and off, and the Get Started button stays disabled and greyed out until it is ticked, then activates and advances to Personalize.
Personalize Step 2 of 3	"Your first name" text field, wake-up and go-to-bed time pickers defaulting to 07:00 AM and 09:00 PM. Continue saves the name and waking-hours range, used later to auto-space dose times. Back returns to step 1 without losing previously entered data.
Quick Start Step 3 of 3	The "Cataract Surgery" card (labelled "Includes 3 medications") automatically creates an antibiotic, a tapering steroid and artificial tears with typical post-op schedules, then proceeds straight to the Today dashboard. "I'll add my own" skips presets and proceeds to Today with an empty medication list. Back returns to Personalize.

SCREEN	ELEMENTS & BEHAVIOUR
Step indicator	Three-dot progress indicator across all three steps, with working Back navigation throughout.

3.2 Today Dashboard (Home)

ELEMENT	BEHAVIOUR
Personalised greeting	Time-aware greeting with the user's first name.
Next-dose banner	Shows the medication, eye(s), time, any special-instruction tag and a live countdown. Always reflects the soonest upcoming, not-yet-logged dose.
Today's progress	Counter and progress bar (e.g. "0 of 19 done"), updated on every logging action.
Dose list	Full time-ordered list for the day. Each row shows the time, coloured bottle-cap swatch, medication name, affected eye(s), any special-instruction tag (e.g. Refrigerate, Shake bottle) and its own checkmark button, which opens the Confidence Check for that specific dose.
Inline spacing banners	"Wait 5 minutes between these drops" appears automatically between two closely timed medications.
Confidence Check modal	<i>Took it</i> marks the dose complete with a timestamp and turns the row's checkmark solid green. <i>Not sure it went in</i> logs the dose with an "unsure" status. <i>Snooze 10 min</i> keeps the dose pending and delays its reminder by 10 minutes. <i>Skip this dose</i> marks it as intentionally missed. <i>Cancel</i> closes the modal with no change. Every choice updates the day's progress counter and is recorded in History.
Bottom navigation	Today / History / Meds / Settings, present on every main screen, switching between sections without reloading the app.

3.3 History & Reporting

ELEMENT	BEHAVIOUR
Adherence cards	7-day adherence %, 30-day adherence % (each with dose counts) and a "Streak" card showing perfect days.
Month navigation	Back and forward arrows change the displayed month and reload that month's colour-coded adherence data.
Calendar grid	Tappable day cells, each coloured by that day's adherence level, with the legend All doses / Some / None.
Day detail panel	Tapping a day cell expands a panel beneath the calendar listing every dose scheduled that day (time, medication, eye) with its logged status and timestamp, or a dash if not yet logged. A close (X) button collapses it; tapping a different day swaps the contents; tapping the same day again toggles it closed.
Doctor Report	Header block with patient name, generation date and reporting period; overall adherence; one summary card per medication showing Adherence %, Taken, Missed and Unsure counts. Back returns to History; Print lets the user print the report or save it as a PDF to share with their eye doctor.

3.4 Medications Management

ELEMENT	BEHAVIOUR
Medications list	Per-medication row with a coloured bottle-cap indicator, name and eye / frequency / times summary, plus three icon buttons: Add to Calendar, Edit (pencil) and Delete (trash). "Add" in the header opens a blank Add Medication form.
Add to Calendar	Exports an .ics calendar file containing that medication's reminder times.
Delete	Permanently removes the medication and its future reminders — a destructive, non-reversible action.
Medication name	Text field.
Bottle cap colour	Eight selectable colour swatches; selecting one highlights that choice.
Which eye?	Single-select: Right eye / Left eye / Both eyes.
Frequency	Single-select: Once daily, Twice daily, 3× daily, 4× daily, Every N hours, Custom times. Selecting an option immediately regenerates the Dose times section below it.
Dose times	Once / Twice / 3× / 4× daily auto-generate that many dose-time fields evenly spaced across the user's configured waking hours, which can still be fine-tuned manually. "Every N hours" replaces the time-picker list with a single numeric interval field (default 4 hours), computing rolling reminder times from the medication's start time. "Custom times" leaves full manual control via "+ Add time" and the per-row remove (X) buttons.
Start date & Ongoing	Start date field plus an "Ongoing (no end date)" checkbox; unchecking it reveals a required End date field for temporary regimens.
Special instructions	Five checkboxes — Shake bottle, Refrigerate, Wait 5 min before next drop, Remove contact lenses, Press tear duct after — plus a free-text "Additional notes" field. Any checked instruction appears as a small tag on that medication's rows across the Today and Meds screens, and drives the inline spacing banners. Notes are stored as plain text and shown on the medication's detail views.
Taper schedule (optional)	" + Add step" appends a taper stage. Each step contains a date field, a frequency dropdown with the same six options, an auto-computed "Times:" preview and its own remove (X) button. Multiple steps chain into a step-down regimen (e.g. 4× daily for a week, then twice daily, then once daily) that automatically changes the medication's active frequency on each step's start date. Removing a step deletes only that stage.
Save / Update	The submit button reads "Save Medication" on a new entry and "Update Medication" when editing. Submitting validates required fields and returns to the Medications list with the change applied, and the new or updated schedule is immediately reflected on the Today dashboard. Back discards changes. The Add form is structurally identical to Edit but starts blank, defaulted to Both eyes and 4× daily.

3.5 Settings & Account

ELEMENT	BEHAVIOUR
Your name / Waking hours	Text field and from/to time pickers. Save Settings persists both and recalculates the auto-suggested evenly spaced dose times used for Once / Twice / 3× / 4× daily medications across the app.
Safety disclaimer	Persistent banner stating the app is a reminder and tracking tool only, not a medical device, and to contact the eye care provider or pharmacist if unsure.
Add all reminders to Calendar	Downloads a single combined .ics file covering every active medication's reminders. Retained alongside the native reminders.
Restart Onboarding	Relaunches the 3-step onboarding flow without deleting existing medications.
Log Out	Ends the current session.
Guest mode	The app can be used with data stored locally on the device without requiring sign-in, as in the prototype.
Version footer	App version shown beneath the Log Out button.

04 Additions Specific to the Mobile Apps

Beyond the prototype's feature set, the native apps need a small number of mobile-only items:

- **Real reminders.** Local, alarm-style notifications scheduled on the device, replacing the .ics export as the primary reminder mechanism.
- **Privacy Policy and Terms of Service links.**
- **In-app account deletion**, required for iOS.
- **A simple web portal** to handle the Android account-deletion flow.
- **Battery-optimisation guidance screen.** A screen guiding the user to allow the app to run with no restrictions, so scheduled notifications are not killed by the device.

The project is delivered in three milestones. Each one is released only once the work in it has been tested and approved.

#	MILESTONE	WHAT IT COVERS	AMOUNT
M1	Mobile application frontend prototyping	A programmatic prototype you will be able to test on your own phone with mocked data — the full screen set, navigation and interactions of the app, built natively rather than as a design file.	\$500
M2	Mobile app backend integration	Connecting the database with the app, and adding the notifications, the alarms / reminders logic, and the battery-optimisation code. After this step you will have a fully working app.	\$1,000
M3	Deployment	App Store and Google Play submission end to end, including developer account and certificate setup guidance, privacy labels, and all resubmissions if the app is rejected. Detailed in Section 08.	\$100
Total — Drop Tracker for iOS and Android, submitted to both stores			\$1,600

A timeline will be confirmed once the database approach is finalised (Section 06). Two months of free support are included after launch, as set out in Section 10.

06 Database Approach & Data Location

The database approach is the remaining open item. Depending on the project's requirements we can use a **local database**, **Firebase**, **Supabase**, or **custom-coded APIs**. Once this is finalised I will be able to provide a realistic timeline and an accurate pricing estimate.

If the mobile apps are going to use the same backend as the web prototype, I will also need access to the prototype and its backend.

Canadian data residency

For health-related information on Canadian users, both cloud options can be pinned to a Canadian region:

OPTION	CANADIAN REGION
Firebase	northamerica-northeast1 (Montréal) or northamerica-northeast2 (Toronto)
Supabase	ca-central-1

I am happy to use whichever of them suits you.

07 Testing, Builds & Revisions

- I do developer testing of the app myself before anything is handed over.
- Builds are shared after each milestone is completed, so you are testing the real app as it is built.
- A milestone is complete only when it has been properly tested by me **and** by you.
- Continuous builds are provided at the end of each milestone once that milestone's work is done.

08 Deployment & Store Submission

The deployment fee covers App Store and Google Play submission end to end, including:

- Developer account and certificate setup guidance.
- Privacy labels.
- Submission to both the App Store and Google Play.
- **All resubmissions.** If the app is rejected, resubmissions are included in this cost at no extra charge.

09 Ownership, Accounts & Source Code

- The complete code will be in your ownership, with IP ownership transferred to you.
- The complete source code of each milestone is submitted to you via Fiverr as the project progresses.
- You provide and own all development accounts — Apple Developer, Google Play, and the Firebase account or database — so they stay in your name. My role is developing the application.
- I am happy to sign an NDA before receiving source files or backend access.

10 Support & Maintenance

Two months of free support are included. The definitions below are also outlined in my gig description:

CATEGORY	DEFINITION	IN SUPPORT PERIOD
Bug	Any issue where an existing feature crashes, malfunctions, or doesn't work as intended.	No extra cost
Revision	Minor changes such as UI colour adjustments, text updates, or other small cosmetic refinements that fall within the agreed revision scope.	Within scope
Update / New feature	Any functionality or enhancement beyond the original agreed scope that isn't a bug or a minor revision.	Billed separately

After the two months of free support, any bugs related to my original implementation can still be addressed, but ongoing maintenance, new features, or additional changes will be charged based on the scope and complexity of the work.

11 Section Notes — Answers to Your Questions

Your six questions, answered here in writing so the proposal and our conversation agree.

Q1 Deployment — does the \$100 cover App Store and Google Play submission end to end, including account setup, privacy labels, and any resubmissions if we get rejected?

Yes, it includes everything mentioned. All resubmissions are included in this cost.

Q2 QA and revisions — how many rounds of feedback are included per milestone, and what's the process when something comes back?

I will do developer testing of the app and will also share builds after each milestone is completed. So each milestone will be completed when it's properly tested by me and by you. I will provide continuous builds at the end of each milestone once the milestone work is done.

Q3 Team — will you personally be doing the development, or is it someone on your team?

Yes, on this project I will personally be doing all architecture planning, development and deployment. I have team members, but they are busy on other projects of mine.

For all the projects on which a team member works, the work is always approved and properly tested by me, and their architecture is created by me.

Q4 Data location — can Firebase be configured for a Canadian region, and have you worked with data residency requirements before?

For the data constraint we have two options:

Firebase — we can select *northamerica-northeast1* (Montréal) or *northamerica-northeast2* (Toronto).

Supabase — Canadian region *ca-central-1*.

I will be happy to use whichever of them suits you.

Q5 Ownership — full source code delivered with IP transferred to me, and the Apple Developer, Google Play and Firebase accounts under my own credentials.

Yes, the complete code will be in your ownership, and you will provide all development accounts, Firebase accounts or database. We will only be developing the application, and will submit the complete code of each milestone via Fiverr.

Q6 Support window — after the 2 free months, what counts as a bug you fix versus a change you charge for, and what's your rate for work after that period?

The definitions of bugs, revisions and feature updates are also outlined in my gig description, but here's a clearer explanation:

Bug — any issue where an existing feature crashes, malfunctions, or doesn't work as intended. These are covered during the support period at no additional cost.

Revision — minor changes such as UI colour adjustments, text updates, or other small cosmetic refinements that fall within the agreed revision scope.

Update / New feature — any functionality or enhancement beyond the original agreed scope that isn't a bug or a minor revision is considered a new feature or update and is billed separately.

After the 2 months of free support, any bugs related to my original implementation can still be addressed, but ongoing maintenance, new features or additional changes will be charged based on the scope and complexity of the work.
